

Geckos do not have eyelids, so they lick their eyes clean instead of blinking.

Male anoles extend their colored throat fans to signal to rival males and potential mates.

Basilisks live near water and escape danger by running across the surface.

Protective spines cover the thorny devil's bizarre body. It eats ants in the Australian desert.

The male rainbow agama's vivid courtship colors contrast with camouflaged females.

The Australian frilled lizard has a peculiar neck frill used to startle potential predators.

Skinks have short legs and smooth, shiny scales. Some reveal bright blue tongues if threatened.

Wall lizards often blend in with rocks and plants. They are agile, fast-moving insect-eaters.

The slowworm is a legless lizard with a snakelike body. It gives birth to live young.

The largest monitor lizards grow to a length of 10 ft (3 m) and pack a venomous bite.

Boas and pythons lack venom, but they kill by squeezing with their heavy, muscular bodies.

Green and extremely slender, vine snakes are well hidden up in the trees, where they live.

Cobras open their hooded necks during threat displays. They are highly venomous.

Sea kraits are venomous fish-eaters with tails like paddles. They return to land to lay eggs.

Vipers' long, hinged fangs swing forward and deliver venom when attacking prey.

Crocodylians

The world's biggest reptiles belong to this group of heavily armored predators. Expert swimmers and divers, they often lurk in the shallows, where they attack animals at the water's edge. They breed by laying eggs. Unusually for reptiles, they look after their young.

Caimans bury themselves in mud during droughts. They live in Central and South American rivers.

Compared to crocodiles, alligators have a broad, rounded snout. They live for around 50 years.

The largest crocodiles are the biggest living reptiles, with a length of up to 20 ft (6 m).

Gharials' extremely slender snouts move quickly through the water to snap up fish.
