

*Penguins cannot fly but they swim gracefully. On ice they waddle or slide on their stomachs.*

*Grebes eat fish and have paddle-shaped toes. They often carry their young on their backs.*

*Flamingos have long legs and necks and bent beaks that they use upside down to filter food.*

*Waders, such as this avocet, feed on shorelines and in wetlands. Most have long legs and many have long bills, which they use to probe into mud for worms and clams.*

*With long legs, herons hunt by stealth in the shallows, using their beaks to stab their prey.*

*Some pelicans fish by dive-bombing, scooping up fish with their pouched beaks.*

*Bald eagles have a hind talon on each foot that pierces fish as the bird grabs them from the water.*

*Auks, which include puffins, live on the coast and dive for fish, using their wings to swim.*

*Pigeons have plump bodies and eat seeds and fruit. Some have large crests.*

*Macaws have long tails and colorful plumage. They are the largest flying parrots.*

*As nocturnal hunters, owls hide by day, camouflaged by their mottled plumage.*

*Swifts hardly ever land, except when nesting. They eat insects and even sleep in midair.*

*Woodpeckers have chisel-like beaks. They hammer holes in trees to reach insect grubs.*

*Toucans live in the tropics and eat fruit with enormous and often brightly colored beaks.*

*Kingfishers return to a favorite perch after a catch, striking the fish before swallowing it.*

*Icterids use their sharply pointed beaks to force open gaps to get at hidden food.*

*Wood warblers eat insects with their short, pointed beaks and typically nest in woodlands.*

*The largest songbirds are crows, which are often adaptable and intelligent but have harsh calls.*
