

Crowning glory

Creeping over rocks off the coast of Borneo, a sea slug, or nudibranch, shows off its stunning color scheme. It has two yellow horns, or rhinophores, which sense food by smell, but its most eye-catching feature is a tuft of feathery gills. Spreading out in the water, these thin flaps collect oxygen, letting it pass into the sea slug's blood. Sea slugs have very poor eyesight and cannot see their amazing colors themselves. Instead, they use them as a warning to other animals, showing that they are not good to eat.
