

Fish pack together for protection

Underwater roundup

Herded together by a pod of common dolphins, this shoal of fish instinctively tightens up into a whirling mass called a bait ball. The dolphins speed around the boundaries of the ball and then take turns plunging through its center, grabbing the slippery fish with their pointed teeth. Dolphins communicate with a complex language of whistles and clicks, which helps to coordinate their attack.

Chimpanzee ambush

Chimpanzees eat almost every kind of food, from leaves and fruit to bird's eggs and young animals. Most of the animals they catch are small, but in some parts of Africa, chimpanzees work together to chase down colobus monkeys high up in trees. Colobus monkeys are the more agile climbers, but a hunting party of chimpanzees can outwit them by planning an ambush. Some of the chimpanzees hide in the treetops, while a driver surprises their prey, setting the trap in motion. The monkey victim tries to escape through the trees, but it is steered along a path by chimps that block its escape on either side. Together, the chimps drive the prey toward a hidden ambusher, which makes the final kill.
