

Dragon millipede

## Myriapods

Like insects, myriapods have one pair of antennae, but instead of three body segments, they can have more than 100! Millipedes and centipedes, the most common myriapods, can have more legs than any other creature on the planet.

Pill millipede

Giant tiger centipede

Common centipede

## Crustaceans

Almost all crustaceans live in the water and are well adapted to aquatic life. Most people don't consider crustaceans to be bugs, but there is one small exception: wood lice. They are the only crustaceans to spend their entire lives on land and can often be found in gardens and woodlands.

American lobster

Dungeness crab

Wood louse

## WORMS

Earthworm

Worms have long, thin bodies and no legs. Segmented worms, like earthworms, have long muscular bodies split up into segments.

They are very good at burrowing and swimming. Flatworms are very basic creatures, which usually live as parasites in the bodies of other animals.

Leech

Red mangrove flatworm

## MOLLUSKS

Mollusks are soft-bodied invertebrates. Most of these bug relatives have hard protective shells, and some have tickly tentacles! Lots of them live in the ocean, but some live on land.

Mussel

Oyster

Octopus

## Gastropods

The biggest group of mollusks is the gastropods. They have muscular bodies, hundreds of small teeth, and sensory tentacles for seeing and feeling. Most gastropods have shells, but some, like slugs, don't.

Nudibranch sea slug

Sea snail
