

Butterfly

Scaly wings

Butterfly wings are covered in thousands of tiny scales. Their wings can be brightly colored to attract mates or to warn predators to stay away.

Fly

Balancing act

A fly has one pair of large wings for flying and a tiny pair, called halteres, for balance.

Wonderful wings

Of all the flying animals, insects were the first to take to the skies. Millions of years before pterosaurs, birds, or bats, insects buzzed, fluttered, and flapped through the air.

Noisy wings

Crickets make chirping sounds by rubbing the upper and lower parts of their wings together.

Cricket
