

Eye spy

Whether it's for **finding food, sensing light, or escaping attack**, eyesight is incredibly important for many bugs. Their eyes come in many different shapes and sizes. Some bugs have multiple eyes, each with a special function.

COMPOUND EYES

Insects and crustaceans have compound eyes, which are made up of lots of tiny lenses. They are usually **great at spotting movement** but not good at seeing details. Dragonflies and praying mantises have eyes that are very good at both.

Damselflies have two huge compound eyes that cover most of their head!
