

Snails belong to a group of invertebrates called "mollusks." Many mollusks have hard protective shells and tentacles.

BUGS AND THEIR RELATIVES

Insects, arachnids, and other creepy-crawlies are closely related to millions of other small creatures because they are all invertebrates. This broad group of animals includes arthropods, worms, and mollusks.

Although they belong to one big family, bugs and their relatives don't all look the same. From wriggling worms to scuttling spiders, they come in thousands of different forms.

The biggest group of invertebrates is the arthropods. This huge family includes insects, arachnids, myriapods, and crustaceans. And each of these families contains many fascinating members.

With so many weird and wonderful bug families to learn about, there is always something new to discover.
