

European garden spider

Most spiders and scorpions make a toxic substance called “venom.”

SCORPIONS

Like all arachnids, scorpions have eight legs. They also have big, grasping pincers that are actually part of their mouths! A scorpion’s most famous feature is its long, arching tail, which it uses to sting and pin down its prey.

Scorpions have **stingers** on the tips of their tails to deliver venom.

Bark scorpion

Pincers allow scorpions to catch prey, scoop up water, and dance with mates.

Water spider

Water spiders carry **air bubbles**, so they can breathe underwater.

ARACHNIDS

The biggest group within the arachnid family is the spiders, but these other eight-legged creatures are just as fascinating.

Vinegarroon

This tropical arachnid protects itself by spraying acid out of its bottom.

Whip spider

Despite its name, this cave-dwelling arachnid is not a spider. It uses its extra-long legs to feel its way in the dark.

Mites and ticks

These bugs are called parasites, because they often live off the blood of other animals.

Daddy longlegs

Often confused with spiders, daddy longlegs are also known as harvestmen.
