

Millipedes and centipedes are able to regrow lost legs!

CENTIPEDES

Centipedes are quick-footed hunters, capable of killing small vertebrates like lizards, snakes, and bats. They scuttle speedily in pursuit of their prey and can deliver venomous bites using their fang-like front legs.

Jungle centipede

Common centipede

Waterfall centipede

Centipedes have one pair of legs on each body segment.

Giant tiger centipede

MYRIAPODS

It isn't always easy to tell these strange creatures apart. Let's get to know them better.

Pill millipede

Sometimes confused with wood lice, pill millipedes (or "pillworms") have much shorter bodies than other millipedes.

Flat-backed millipede

As the name suggests, these millipedes have flattened bodies rather than rounded segments.

House centipede

Long-legged house centipedes can often be found scuttling around homes, eating cockroaches and other pests.

Scolopendra

These enormous tropical centipedes hunt birds, amphibians, and mammals.
