

SEA SLUGS

The most common type of sea slug is the brightly colored nudibranch. It is often found in shallow tropical waters. Most nudibranchs have two hornlike tentacles and a fan of feathery gills.

Blue dragon nudibranch

Nudibranchs are often carnivores. They eat fish, algae, coral, and even other nudibranchs!

Sea bunny nudibranch

GASTROPODS

Most members of the gastropod family live underwater; only slugs and snails are found on land.

Slug

Soft-bodied slugs have no visible shells. They are often found in dark, moist places.

Snail

Snails have shells to protect their bodies. They can live in freshwater, seawater, and on land.

Limpets

The dome-shaped shells of limpets are usually seen clinging to rocky shores.

Abalones

Also known as sea-ears, these marine gastropods are hunted for their meat and beautiful shells.
