

Beetles, flies, butterflies, bees, wasps, and ants also undergo **complete metamorphosis**.

Once its wings have straightened out and dried, the adult moth flies off to find a mate.

When an adult moth first hatches, its wings are wet and crumpled.

Adult luna moth

ADULT

The fourth and final stage of **complete metamorphosis** is when the adult moth hatches out of the pupa. It now has wings and looks totally different. The adult moth's main purpose is to mate and lay eggs to continue the cycle.
