

Without dung beetles to clean up, fields and savannas could be overflowing with animal poop!

When they need to move quickly from place to place, dung beetles unfold their wings and buzz noisily through the air.

Buried treasure

Some dung beetles are known as "tunnelers." They use their powerful front legs to dig tunnels and bury their precious dung balls underground.

Smelly poop from omnivores (animals that eat plants and meat) is easier to find, but dung beetles **prefer the poop of herbivores** (plant eaters) like elephants, rhinos, sheep, and cows.

Home sweet home

While some dung beetles roll dung balls back to their nests, "dwellers" prefer to burrow into the dung heap and make themselves at home where they are.
