

A bee colony's home is called a **hive**. This is where they transform **nectar** into **honey**.

Honeybees dancing in the hive

Tiny dancers

If there is a source of nectar close to the hive, the returning bees dance round and round in a circle. If flowers are farther away, bees do a detailed dance, called a waggle dance, which tells the worker bees exactly where to look.

The **angle** of the waggle dance shows the direction of the flowers.

The **length** of the waggle dance indicates how far away the flowers are.

Honeybee colonies consist of a queen, drones, and thousands of workers. Each bee has a specific job.

Honeybees build hexagonal honeycomb cells to store honey.
