

HEARING

Excellent hearing helps bugs escape predators and find mates.

They can often hear sounds at much higher pitches than we can.

Mosquitoes choose their mates based on the sound of their buzzing wings.

Bat

Some **moths** can hear high-pitched bat ultrasound and fly away to avoid being eaten.

Moth

Some bugs have ears in unexpected places. **Grasshoppers and katydids** have ears on their forelegs!

Earthworms don't have ears. These bug relatives detect animals moving nearby through vibrations.

Katydid

Ear

Super senses

Bugs and their relatives experience the world very differently from humans, but they use the same **five basic senses** to survive.

TASTE

We use our tongues for tasting, but bugs and their relatives can **use many different body parts**, including their feet!

As soon as they land, flies use their feet to decide if the food is good or not.

Fruit fly

Garden snail

Tentacle

Slugs and snails use their **tentacles** for tasting.

White-faced hornet

The white-faced hornet is a meat eater, but it is also drawn to sweet and sugary substances.
