

SMELL

Insects use their antennae to smell their surroundings. Moths' antennae are so sensitive that they can smell things many miles away.

Ants have a strong sense of smell, which they use to identify intruders in their colonies.

North American honeybee

SIGHT

Some bugs cannot see, while others can see much more than humans! Sight is particularly important for pollinators, which are drawn toward the tastiest plants by bright and colorful flowers.

Horsefly

Golden orb-weaver spider

Spiders can feel the smallest of vibrations in their webs.

TOUCH

Tiny hairs cover the bodies of many bugs. These hairs are very sensitive to vibrations, helping bugs detect moving predators and prey.

Antenna

Cockroaches have poor vision, so they use their **antennae** to feel their surroundings. They are also very **sensitive to vibrations**, which is why they are so skittish.

Water strider

Water striders can sense ripples on the water's surface.
