

Living underwater

Some invertebrates live their whole lives underwater. With no air to breathe, and hungry fish around every corner, these ingenious bugs have evolved **fascinating ways to survive in their underwater world.**

Breathing underwater

Some bugs, such as mayfly nymphs, have evolved gills to extract oxygen from the water. But other underwater bugs still need to get their oxygen from the air.

Underwater explorers

Underwater bugs move through their watery ecosystem in many different ways. Some swim through the water using their legs as paddles; others clamber about on rocks and plants. Some can even skate across the water's surface!

Diving beetles carry bubbles of air attached to their bodies.
