

Some bugs spend part of their life
underwater and part of it flying
through the air!

Mayfly

Dragonfly

Water
striders

Back swimmers use
their oar-like legs to
propel themselves jerkily
through the water.

Dragonfly nymph

Leaving home

Some dragonflies spend many
years underwater as dragonfly
nymphs before hatching into
adult dragonflies. They shoot
through the water by
releasing bubbles from
their bottoms!

Water scorpions use their
long tails as snorkels,
allowing them to stay under
the water while breathing
air from above the surface.

Apple snails
produce layers of
mucus to glide along
rocks and vegetation.
