

Only reproductive termites have wings.
Their job is to fly off and start new colonies.

Inside the mound, a **maze of tunnels** leads to rooms.

Queen

Termite larvae

Headlight beetle larvae

Soldier termites defend the mound against intruders using their armored heads.

Headlight beetle larvae burrow into termite mounds and release a green glow. The bright green lights lure their prey to them.

Life cycle

While ants, bees, and wasps all go through four distinct life stages of egg, larva, pupa, and adult, termites do not. When they hatch, baby termites look like tiny versions of the adults.

Although termites seem similar to ants, they are actually more **closely related to cockroaches**.
