

Ant lion larvae

Ant lion larvae dig funnel-shaped craters in soft sand, then lie in wait at the bottom. When an ant tumbles into the trap, they flick grains of sand at their victim until it falls into their waiting jaws.

Ant lion larvae eventually turn into ant lions, which look a little like damselflies.

Ant lion larvae have huge jaws as big as their heads!

Trap-door spiders

These spiders live in silk-lined tunnels, which they dig with their mouths. They sit waiting behind doors made of silk, then pounce on unsuspecting bugs as they pass by.

Female trap-door spiders can spend their whole lives inside their tunnels, making them wider as they grow.

Digger wasps

The solitary digger wasp lays each of her eggs in its own underground nest, which she digs using spiny brushes on her legs. Before sealing each hole, she pops in a paralyzed bug for her baby to feed on when it hatches.
