

Arctic bumblebees have thicker hair than their southern cousins, which allows them to withstand the cold.

Snow fleas have special springlike body parts to help them hop through the snow.

Himalayan jumping spiders live on some of the highest mountains in the world, including Mount Everest.

MOUNTAINS

High up in the mountains, bugs must survive with **little air and food** and withstand freezing cold temperatures.

Giant tube worms rely on bacteria to survive. They can grow to over 6 feet (1.8 meters) tall.

These bug relatives are called **yeti crabs**. They collect bacteria on their bristly arms.

Deep-sea mussels thrive in the sulfurous water produced by the vents.

HYDROTHERMAL VENTS

Openings on the ocean floor spurt out boiling hot seawater. **Bacteria** living in these vents feed almost all deep-sea life.
