

BUGS AND ME

For millions of years, bugs have lived and thrived on planet Earth. But since humans have been around, life has changed for just about every type of animal—bugs included.

The number of bugs is changing. Some species of bugs have increased in number, often as a result of human activity. But other bug populations have decreased, and some bug species are in danger of disappearing completely.

If we treat the environment kindly, bugs and humans can live in harmony for many years to come. Whenever we use, eat, or farm bugs, we must do so in a responsible, respectful, and sustainable way.

Most of all, we must remember that even though bugs are small, they are very important to our planet, so we must do all we can to protect them.

A jar of **peacock butterfly caterpillars**. Collecting bugs can be a great way to learn more about them, but always remember to put them back where you found them after you've finished.
