

Bug menu

People all over the world have been crunching on crawly critters since the very first human civilizations. Roughly one-quarter of people around the world still eat bugs, and there are more than 2,000 different types for them to choose from! In the future, bug grub could become one of the main sources of protein for our growing population.

APPETIZER

Mopane worms

Boiled and sun dried, mopane caterpillars are high in iron, magnesium, and zinc.

Ants

Zingy lemon ants from the Amazon rain forest refresh the mouth during meals.

Tarantulas

Deep-fried spiders are a common roadside snack in Cambodia.

Stick insects

Not a taste for everyone, stick insects have about as much flavor as a twig.

Escamoles

Also known as "insect caviar," these Mexican ant larvae taste like smooth and buttery cream cheese.

MAIN COURSE

Cockroaches

When fed fruit and vegetables, cockroaches are full of healthy vitamins.

Termites

Fire-baked termites are dripping with fat and are a great source of protein, too.

Locusts

Usually fried or boiled into a broth, locusts have a slightly sweet taste.

Giant water bugs

Favorites across Thailand and Vietnam, giant water bugs taste like fishy scrambled eggs.
