

SCOLECITE

Monoclinic

H 5–5½ • SG 2.25–2.29

This zeolite is a hydrated calcium aluminosilicate. Usually colourless or white, it is common in igneous and metamorphic rocks.

**ANDESINE**

Triclinic

H 6–6½ • SG 2.66–2.68

A plagioclase feldspar, andesine is a grey or white sodium calcium aluminosilicate. It is widespread in igneous rocks.

**HYALOPHANE**

Monoclinic

H 6–6½ • SG 2.81

A relatively rare barium feldspar, this potassium barium aluminosilicate is colourless, white, yellow, or pink.

NATROLITE

Orthorhombic

H 5–5½ • SG 2.2–2.26

One of the most widespread zeolites, this hydrated sodium aluminosilicate occurs in cavities in basalts, and in hydrothermal veins.

**ANALCIME**

Triclinic

H 5–5½ • SG 2.24–2.29

This pale zeolite, a hydrated sodium aluminosilicate, occurs in igneous, metamorphic, and some sedimentary rocks.

SODALITE

Cubic

H 5½–6 • SG 2.27–2.33

The feldspathoid mineral sodalite is a sodium aluminium silicate chloride. Rare crystals have been found in Canada.

**STILBITE**

Monoclinic

H 3½–4 • SG 2.19

This widespread zeolite is a hydrated sodium calcium potassium aluminosilicate. It forms sheaf-like crystals in a variety of rock types.

**HARMOTOME**

Monoclinic

H 4–5 • SG 2.41–2.47

This widespread zeolite is a pale hydrated barium calcium potassium sodium aluminosilicate. It occurs in hydrothermal veins and volcanic rocks.

**ALBITE**

Triclinic

H 6–6½ • SG 2.6–2.65

A plagioclase feldspar, albite is a pale-coloured sodium aluminosilicate. It is an abundant mineral.

**ANORTHOCLASE**

Triclinic

H 6–6½ • SG 2.57–2.6

An alkali feldspar, anorthoclase is a sodium potassium aluminosilicate occurring as prismatic or tabular crystals.

**LAZURITE**

Cubic

H 5–5½ • SG 2.38–2.45

The intense blue feldspathoid mineral lazurite is a sodium calcium aluminosilicate sulfate. It is the main mineral in lapis lazuli gems.

**THOMSONITE**

Orthorhombic

H 5–5½ • SG 2.23–2.29

A pale-coloured zeolite, thomsonite is a hydrated aluminosilicate of sodium and calcium, widespread in cavities in basalts.

LAUMONTITE

Monoclinic

H 3½–4 • SG 2.23–2.41

A widespread zeolite, laumontite is a hydrated calcium aluminosilicate. It occurs in igneous, metamorphic, and sedimentary rocks.

**POLLUCITE**

Cubic

H 6½ • SG 2.9

A rare zeolite, this complex hydrated aluminosilicate of caesium and sodium commonly contains other elements, such as calcium. It is a source of caesium.

**ORTHOCLASE**

Monoclinic • H 6 • SG 2.55–2.63

Orthoclase, an alkali feldspar, is a potassium aluminosilicate. It is a major component of many igneous and metamorphic rocks.

**MESOLITE**

Orthorhombic • H 5 • SG 2.26

This white or colourless zeolite occurs in igneous and metamorphic rocks. It is a hydrated sodium calcium aluminosilicate.

HAÜYNE

Cubic • H 5½–6 • SG 2.44–2.5

A feldspathoid mineral, haüyne is a sodium potassium calcium aluminosilicate, with sulfate and chlorine. It occurs mainly in silica-deficient volcanic rocks.
