

## CHICORY

(*Cichorium intybus*)

The root of this wild plant, identified by its pretty blue flowers, is often used in tisanes. Like burdock root (see opposite), chicory contains inulin, which makes it a powerful probiotic agent. Chicory detoxifies, helps to strengthen the immune system, and is used to treat arthritis because of its anti-inflammatory qualities. It also has a sedative quality and is often used in tisanes to aid sleep.

## DANDELION ROOT

(*Taraxacum officinale*)

Often considered an invasive weed, dandelion is frequently used in tisane mixtures owing to its anti-inflammatory qualities and ability to help reduce pain and swelling. It also aids digestion and supports good bacteria in the intestines.

## GINGER

(*Zingiber officinale*)

Widely used as a culinary spice, ginger has become a popular ingredient in herbal infusions. It is an anti-inflammatory and helps detoxify the body; it contains terpene and ginger oil, which help stimulate blood circulation and cleanse the lymphatic system. Ginger root, therefore, is used to help treat digestive ailments, nausea, and the symptoms of colds and flu.
