

FINDING THE RIGHT TEMPERATURE

Heating the water to the correct temperature is key to making a good cup of tea. A fresh, fragile green leaf will be scalded if boiling water is poured over it; partially oxidized teas, such as oolongs, will need hotter, but not boiling, water, and fully oxidized black teas will need boiling water to release their flavors. Whatever the desired infusion temperature, always begin with freshly drawn cool water.

If you don't have a variable temperature kettle, boil the water and let it sit in the kettle with the lid open for 5 minutes for green, white, and yellow teas; 3 minutes for oolong; and 2 minutes for Pu'er and other dark teas.

THE OPTIMUM WATER FOR TEA HAS
A NEUTRAL PH OF 7, LOW DISSOLVED
MINERAL CONTENT, AND NO CHLORINE
OR OTHER GASEOUS ODORS
