

Cirrocumulus

These tiny balls of icy cloud often form what is called a “mackerel sky,” because they look like the scales of a mackerel fish.

Cirrus

Cirrus tend to be the highest clouds of all. They form streaks across the sky that tell of strong winds blowing. They are a sign of unsettled weather.

Altocumulus

These are medium-height cumulus clouds. They look like flattened balls of cotton that are almost joined together.

Cumulus

Fluffy cumulus clouds are easy to spot. These low-level clouds sometimes develop during the day and get bigger, giving showers.

Stratocumulus

If you see long rolls of these medium-height clouds, this usually means fair weather is on the way. They are made by cumulus clouds spreading out in layers.

Cumulonimbus

These are the towering clouds that give us thunderstorms and even tornadoes. A big one may be taller than Mount Everest!
