

Rime frost only forms on one side.

Ice needles

If fog forms in very cold air, the tiny water droplets that make up the fog freeze onto anything they touch. The ice builds up in thick layers called rime. This is often swept into strange shapes by the wind.

Winter fun

It is lucky for us that ice floats on water. When it is really cold, ponds, lakes, and canals are covered with a layer of ice. If ice sank, not only lakes but all the seas would slowly turn into solid ice!

Ice is frozen water.

Never walk or skate on ice unless an adult has first checked that it is safe!
