

Midafternoon

Midafternoon is the warmest time of the day. Often, though, the morning's fluffy cumulus clouds can build up and up until they interrupt the afternoon with brief but heavy showers of rain, or even thunderstorms.

Night

Once the Sun has dropped below the horizon it gets steadily colder—especially if there are no clouds to keep the heat in.

Toward sunset

As the Sun drops lower toward sunset, its power to stir up the air gets less and less. So the end of the day is often calm and clear, with barely a cloud in the sky.
