

What is weather?

Weather is just the way the air around you changes all the time. It can be still, moving, hot, cold, wet, or dry. Most importantly, weather is the way water changes in the air. Without water, there would be no clouds, rain, snow, thunder, or fog. The weather plays a big part in our lives and affects many of the things that we do.

Weather places

Weather is different in different parts of the world. In deserts, for instance, it very rarely rains, while in tropical jungles, it is hot and steamy. Climate is the usual kind of weather that a place has over a long period. For example, the Arctic has a cold climate.
