Electronic soldering station

JB Instruments introduces the i-CON 1 MK2, an 80W electronically controlled

soldering station for industrial production, rework, and R&D applications.

A motion sensor enables standby mode, extending tip life and reducing power consumption. Its intuitive interface allows quick adjustments, while an optical indicator ensures precision. Compatible with fume extraction and heating plates, the antistatic design enhances reliability in sensitive environments.

TEST & MEASUREMENT

MCT system for streamlined control and monitoring

The MCT system is an advanced control, monitoring, and data logging solution tailored for industries like

semiconductors, automotive, heat treating, packaging,

food and beverage, chemical, HVAC, and laboratories. Featuring a 10.9cm (4.3-inch) touchscreen, it offers intuitive navigation with PC-style or slide-nav menus. It integrates up to three PID loops, a paperless recorder, and multiple communication options, including secure email, FTP, and cloud protocols.

Partial discharge acoustic imager

KUSAM-MECO has introduced the partial discharge acoustic imager model

KM-PDAI, a standalone system for acoustic imaging and signal analysis. It detects electrical faults, gas leaks, and

mechanical issues using 128 digital microphones.

An optional thermal camera allows seamless

switching between acoustic and thermal imaging. With a detection range of 0.3m to 100m, a 17.8cm (7-inch) display, and up to 128GB storage, it suits power, industrial safety, and predictive maintenance applications.

Vector network analyser

Rohde & Schwarz introduces the R&S ZNB3000, a next-generation vector network analyser optimised for high-volume RF component production.

It offers exceptional speed, accuracy, and reliability, supporting applications in communications, consumer electronics, aerospace, and high-speed digital design. Covering 9kHz to 26.5GHz, it ensures precise measurements with a 150dB dynamic range and low trace noise. Its segmented sweep optimises filter testing, while scalability allows expansion to 48 ports. The R&S ZNB3-K50(P) option provides real-time measurement uncertainty bands.

Simulator for 5G IoT testing

Anritsu Corporation launched the virtual signalling tester NR software MX844030PC, a software-based

simulator for 5G IoT chipset and device testing. It virtualises radio functions using software-defined radio (SDR) technology, enabling cost-effective and scalable testing on a PC. Applications include DUT fault detection, performance assessment, power analysis, interoperability verification, and security testing. Supporting 5G

sub-6GHz and RedCap evaluation, it eliminates dedicated hardware, accelerates test cycles, and allows flexible configurations.

MISCELLANEOUS

Digital suite for product development

MosChip Technologies has introduced MosChip DigitalSky GenAIoT, a comprehensive digital solutions suite designed to accelerate smart product

GenAIoT

development. By integrating IoT, AI, Generative AI, edge AI, automation, security, and modernisation, the suite enhances efficiency and shortens product lifecycles. Tailored for industries such as smart homes, healthcare, automotive, and manufacturing, it offers advanced capabilities, including IoT and connectivity for smart device management and edge security, cognitive intelligence for AI-driven decision-making, automation for streamlined workflows and testing.

Engineering platform for faster, smarter designs

Altair has launched Altair HyperWorks 2025, a cutting-edge design and simu-

lation platform tackling complex engineering challenges. This release integrates AI, HPC,

multiphysics simulation, and cloud scalability, enhancing virtual prototyping and reducing physical testing. New transformer-based physics models enable accurate simulations with minimal data, while machine learning solvers cut simulation time. Altair DSIm SaaS offers unlimited semiconductor simulations with pay-as-you-go pricing.
