

level, the system demonstrated 60-70% more thermal headroom, a 40% lower system temperature, and a 75% lower thermal

resistance. These changes help keep the glasses cooler,

support steady performance, and reduce heat-related wear. The system uses a piezoMEMS design with no moving parts, so it runs without sound or vibration and works over time. Its size allows it to fit into the space available in eyewear frames.

Cat 1 bis embedded modem

Airgain has launched the NimbeLink Skywire Cat 1 bis Embedded Modem, the first plug-and-play Cat 1 bis modem certified for direct use in end devices.

This pre-certified solution supports global carrier networks, allowing companies to bypass most

regulatory steps and reduce certification time and costs, enabling product launches up to 80% faster. Designed for use in industrial, healthcare, logistics, and smart city applications, the modem supports IoT devices that require moderate data rates and wide network coverage. Built on Cat 1 bis technology, it offers a balance of performance, power use, and cost. Its single-antenna design reduces component cost and improves connectivity in remote areas, making it suitable for smart meters, asset trackers, gateways, and sensors.

K-band power amplifier

Qorvo has launched the QPA1722, a K-band power amplifier for Low Earth

Orbit (LEO) satellite payloads, offering three times the instantaneous bandwidth, 38% reduction in size, and 10% higher efficiency than comparable

design. Based on Qorvo's GaN-on-SiC technology, the QPA1722 enhances the company's SATCOM portfolio, offering an option for platforms with size and power constraints.

Compact 18-in-1 antenna

Taoglas has launched the Patriot series, a roof-mounted antenna platform for connected vehicle fleets in emergency,

utility, and commercial sectors. Designed to replace the OEM antenna without requiring new holes to be drilled, it fits between

the roof ribs. It utilises existing mounts, thereby reducing installation time, cost, and complexity during both deployment and decommissioning. The Patriot integrates up to 18 antenna elements in one enclosure to support multi-network connectivity while minimising roof clutter. Initially developed for the Ford Interceptor, the series offers 17- and 18-in-1 variants, with flexibility for other configurations based on user needs.

102.4 Tbps switch

Broadcom Inc. has started shipping the Tomahawk 6 switch series, the first

Ethernet switch chip to deliver 102.4 Tbps of bandwidth, twice the capacity of any current alternative. The chip is

designed to support over one million XPU's in a single AI cluster, enabling both scale-up and scale-out networking. It supports multiple network topologies, including scale-up, Clos, rail-only, and torus, and complies with Ultra Ethernet Consortium specifications. Tomahawk 6 features include Cognitive Routing 2.0, which provides telemetry, congestion control, and load balancing. An option with 1,024 100G SerDes in a single chip allows longer copper reach and efficient use of XPU's and optics.

Satellite and aerospace power converter and filter

Microchip Technology has released the SA15-28 radiation-hardened 15W

DC-DC power converter and the SF100-28 EMI filter for use in satellite and aerospace systems.

Designed for satellite manufacturers, defence contractors, and aerospace system integrators, these components support commercial and government space missions. The SA15-28 operates from a 28V satellite bus and meets MIL-STD-461 EMI requirements. It delivers 5V triple outputs and is used for powering FPGAs and MPUs through point-of-load converters and low-dropout regulators. The non-hybrid, isolated design targets space-grade electronics in satellites and constellations.
