

TEST & MEASUREMENT

Resolver simulators

Pickering Interfaces has upgraded its PXI (41-670) and PXIe (43-670)

resolver simulators to support speeds of up to 130,000 RPM, making them ideal

for aerospace, defence, and automotive HIL testing. Users benefit from accurate analogue output with onboard transformers for unmatched accuracy, multi-channel support for dense setups, and programmable fault simulation for robust software validation.

Next-gen AOI system

Test Research, Inc. introduces the TR7500 SIII Ultra, a next-generation

AOI system that combines AI-driven inspection with metrology-grade accuracy. Built on a vibration-resistant cast-iron platform, it handles heavier

PCBs while ensuring stable inspection. Smart factory-ready, it supports IPC-CFX, SECS/GEM, and HERMES protocols for Industry 4.0 integration.

Signal generator

Anritsu's EcoSyn Lite Microwave Synthesiser offers wide frequency coverage from 10MHz to 20GHz in a compact 10.16cm × 10.16cm × 2.03cm

module. It delivers +18dBm output power and ultra-low phase noise, making it suitable for radar, RF transceivers, and high-speed ADC/DAC testing. With < 50µs switching, USB/SPI control, and SCPI support, it is suitable for space-limited, automated test environments.

Future-proof test platform

Liquid Instruments raises the bar in electronic testing with Moku:Delta, a flexible and reconfigurable platform

designed for high-performance labs. From quantum computing to aerospace, it

empowers engineers with precision tools and seamless multitasking in a single device. Think faster experiments, fewer instruments, and future-proof test capabilities, all in one sleek, compact solution.

Universal IC tester

Minmax Electronics' MME-UIT 40 is a versatile microcontroller-based universal IC tester designed for engineers working with both analogue and

digital ICs. It supports a wide range of devices, including ADCs, DACs, op-amps, microcon-

trollers, RAMs, and logic ICs, via a 40-pin ZIF socket and optional test clip for in-circuit testing. With multiple test modes, PC-style keyboard input, RS232 expansion, and word processor functionality, it combines flexibility, ease of use, and rugged fault protection.

PC-based oscilloscopes

Pico Technology expands its PicoScope 9400A series, delivering greater flexibility and precision for high-speed electronics and advanced research. With enhanced band-

width options and ultra-low jitter, these compact, PC-based oscilloscopes offer deep signal insight and robust analysis ideal for demanding applications in semiconductors, communications, and

high-energy physics.

Data acquisition unit

Yokogawa's SL2000 high-speed data acquisition unit delivers fast, multi-channel

measurements of up to 200MS/s, ideal for the mechatronics and

electric power industries. Combining oscilloscope and recorder functions, it captures both short bursts and long trends on a single platform. Its isolation tech ensures accuracy in noisy environments, while IS8000 software streamlines complex tests for EVs, robotics, and energy systems.

HDMI video micro system

Hikrobot's HDMI video micro system displays live 2K images on any HDMI screen, eliminating the need for a com-

puter or software. It is easy to use and comes with a zoom lens and direct HDMI output, so users can start working

right away. The system can stream video for remote training or online classes and is used in settings such as labs, classrooms, factories, and forensic units.

MISCELLANEOUS

Application hub

SECO's new application hub simplifies edge AI with a one-stop marketplace for ready-to-use AI/ML apps. Built for rapid

deployment across various industries, it supports a diverse range of hardware. It enables

monetisation of third-party algorithms, making AI integration faster, smarter, and more accessible for OEMs, developers, and system integrators alike.
