

and cultural resonance across South and Southeast Asia. Green Tiger Mobility embodies eco-conscious innovation in India's automotive landscape, driven by a commitment to environmental responsibility, advanced technology, and reliable service.

The startup serves a broad customer base, from individual two-wheeler owners with ageing petrol engines to commercial riders seeking dependable, cost-effective transport. Their motivations typically include reducing running costs, improving mileage, and adopting greener alternatives.

Ashish notes that the retrofit process is carefully structured to ensure reliability and quality. Although the physical conversion takes about four hours, Green Tiger allows up to two days to complete the full procedure—including inspections, testing, and certification. It begins with a 130-parameter diagnostic check to assess the vehicle's condition. "Once that is completed, the bill of materials is issued, the conversion is carried out, and both manual and cloud-based pre-delivery inspections are conducted. The vehicle is handed back to the customer only after all these steps are thoroughly completed," he adds.

The cost of conversion varies

Ashish Dokania, Founder & CEO, Green Tiger Mobility

slightly by system. A hybrid conversion, with different GST rates, is priced around ₹58,000. A full electric conversion with a portable battery costs approximately ₹52,500. The swappable battery model, developed in partnership with Indofast, is priced at ₹36,000, including RTO registration, GST, and insurance. Without RTO and insurance, the price is ₹32,000.

Green Tiger currently operates a single retrofit centre in Bommanahalli, Bengaluru, with plans to expand through both franchise and company-owned models in North Karnataka, Madhya Pradesh, and

Delhi. Manufacturing is partially in-house and partially outsourced to contract manufacturers across North and South India. While design and testing are conducted internally, components such as wire harnesses, swing arms, and select suspension parts are produced externally, under Green Tiger's intellectual property.

Most electronic components—such as MOSFETs and resistors—are sourced locally through Indian arms of global semiconductor firms. However, cells and motors are imported from China, owing to the lack of high-quality domestic alternatives.

The average turnaround time for a retrofit is two days. Since launching full-scale operations in August 2024, Green Tiger has completed approximately 600 retrofits. The team currently comprises around 55 employees, with operations actively scaling across India.

With 300 million existing two-wheelers on Indian roads, the startup sees vast untapped potential in the domestic market. It has no immediate plans to enter the three- or four-wheeler segments or explore international expansion. The focus remains firmly on strengthening and growing its presence within India.

2 BUD ECOSYSTEM'S SINGLE GenAI STACK FOR CPUs, GPUS, AND EDGE DEVICES

GenAI models, without the need for costly GPUs or vendor lock-in? A new platform says it can deliver just that.

Bud Ecosystem was founded in early 2023 by Jithin VG and Ditto PS as a research lab focused on artificial intelligence and open source model development.

While there is no direct hardware component to their work, Jithin noted that it remains closely linked to electronics. One of the key

challenges, he explains, is enabling large language models (LLMs) and general AI (GenAI) models to run on small electronic devices or standard commodity CPUs—whether on servers, clients, or edge systems. Bud Ecosystem's software is designed to do exactly that, ensuring these models operate efficiently

while maintaining high performance across diverse hardware.

When discussing the key challenges of deploying GenAI across diverse hardware, Jithin says, "A key challenge is that there was no common software layer to support different hardware platforms like Nvidia's CUDA, AMD's ROCm, and
