Automation controllers

GigaDevice's GD32F503/505 microcontrollers (MCUs) target advanced control and automation systems demanding high-speed,

reliable, and secure operation. Built on the Arm Cortex-M33 core, the MCUs

enable precise motor control, real-time industrial automation, and intelligent robotics. Applications span robotic vacuums, digital power supplies, and humanoid robots where efficiency, protection, and performance converge.

Memory fanout gearbox

Credo Technology Group's Weaver fanout gearbox tackles the growing memory bottleneck in AI systems

where processors outpace memory bandwidth. Acting as a high-speed bridge, Weaver expands

limited processor memory lanes into multiple channels, boosting data flow without changing memory types.

Dual coil inductive sensor

Melexis' MLX90514 dual-channel inductive position sensor targets next-generation automotive steering

and motion systems.

Capable of reading two coil sets simultaneously, it supports torque and

angle measurement in steer-by-wire and advanced control architectures.

Integrated gate driver

Littelfuse's new IX4352NEAU low-side gate driver IC targets next-generation

EV traction inverters, motor drives, and onboard DC-DC converters. It en-

ables compact, efficient, and reliable power-switching designs in demanding automotive environments.

Image sensor

OMNIVISION's new OX05C image sensor sets a benchmark for in-cabin

driver and occupant monitoring systems. Ideal for DMS and OMS applications, it enables accurate

fatigue and distraction detection, even at night. Compact and cost-efficient, the OX05C supports dual monitoring from a single camera, simplifying in-vehicle safety system design.

System-on-Chip

Ambiq Micro's new Apollo510 Lite System-on-Chip (SoC) series pushes always-on intelligence to the edge while keeping

power use ultra-low.

It targets wearables, medical devices, industrial sensors, and smart home

systems. The chips handle workloads like health analytics and voice recognition, enabling compact, battery-efficient devices that stay smarter, longer.

Magnetic SoC

iC-Haus has expanded its encoder lineup with the iC-MUE magnetic hollow-shaft encoder SoC, targeting advanced robot-

ics, automation, and motor-drive systems. Designed for high-precision feedback, it measures rotation

angles with up to 21-bit resolution while resisting dust, vibration, and magnetic noise. The device supports multiple interfaces, enabling compact, reliable motion sensing across industrial and robotic applications operating in harsh environments.

TMR-based sensor

TDK has expanded its sensor lineup with new TMR-based solutions built for gaming gear such as controllers,

keyboards, AR/VR systems, and driving wheels.

Designed for fast response and low power, the sensors enable precise motion, gesture, and orientation detec-

tion in compact devices. Combined with MEMS microphones and ultrasonic time-of-flight sensors, they enhance responsiveness, voice interaction, and tracking, helping OEMs deliver more immersive, efficient next-generation gaming experiences.

Image sensors

STMicroelectronics' new 5-megapixel BrightSense image sensors target

motion-intensive and low-light applications in factory automation, robotic vision, biometric access, traffic systems, and smart retail. They combine
