

Integrating MediaTek Genio processors with Arm cores, GPU, and NPU, it enables real-time inferencing for industrial and OEM devices. The board offers flexible AI, display, and camera interfaces for rapid, secure deployment.

Embedded AI developer

Analog Devices' new CodeFusion Studio 2.0 reshapes embedded AI

development by merging design, testing, and deployment into a

unified workflow. Built on VS Code, it lets engineers profile AI/ML models layer by layer, optimise runtimes, and deploy seamlessly across heterogeneous systems, from ultra-low-power nodes to DSPs.

Integrated power supply family

Defence and aerospace systems often struggle to keep power electronics stable under shock, noise, and voltage transients. Gaia Converter's GRD 50A M

series tackles this by combining conversion, filtering, and isolation

into a single 500W rugged module built for COTS-qualified environments. With 1500V DC isolation and MIL-STD compliance, it fits demanding platforms, from land vehicles and avionics to naval or directed-energy systems.

Low-power IoT module

Engineers developing IoT products often struggle with maintaining reliable connectivity in remote or low-signal areas. MIKROE's new NB IoT 6 Click module offers a plug-and-play solution,

delivering low-power narrow-band connectivity through existing LTE networks. Ideal for smart meters, asset trackers, and environmental sensors, it enables long-life, maintenance-

free operation in smart city, industrial, and agricultural systems.

MANUFACTURING EQUIPMENT & MATERIALS

Tray feeder

In high-speed PCB assembly, feeding bulky or delicate components like large

ICs can be a bottleneck. Quasys' JTF3 G3 tray feeder automates this process, supplying such parts directly to pick-and-

place machines. Compact yet robust, it holds up to 24 trays and lifts each into position for precise picking within $\pm 50\mu\text{m}$. It ensures uninterrupted, safe, and consistent component placement.

Selective soldering and dispensing systems

Electronics manufacturers are tackling throughput and precision challenges with Nordson's latest selective solder-

ing and dispensing systems. The SELECT Synchro boosts PCB

assembly speed by up to 40% using synchronous motion for single- or double-sided boards, ideal for automotive and medical electronics. For coating and dispensing, ASYMTEK systems like the SL-1040, SC-450, and Vantage series deliver consistent, micrometer-level accuracy in flexible circuits, MEMS, and

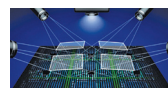

semiconductor packaging where space, speed, and reliability are critical.

Full angle 3D AOI

Electronics manufacturers tackling dense, dual-sided boards now have

a sharper inspection tool. Viscom's latest 3D AOI system

brings eight angled cameras and 3D strip projection to precisely measure solder joints, detect hidden defects, and maintain speed even on miniaturised assemblies.

TEST & MEASUREMENT

Fault insertion units

Pickering Interfaces' new MEMS-based fault insertion units (FIUs) push Eth-

ernet testing toward faster, more reliable validation in automo-

tive and industrial systems. With 50ps switching, over 3 billion cycles, and bandwidth beyond 6GHz, the FIUs ensure durable, high-throughput performance for next-generation HIL and network verification environments.

Pickering Interfaces

Python package

Engineers and developers using PicoScopes can now streamline oscilloscope

automation with pyPicoSDK, a new Python package

built on PicoSDK. Designed for test, measurement, and signal analysis workflows, it integrates oscilloscope control directly into Python scripts,
