Test sockets and change kits

As semiconductor devices shrink and pack more power, reliable testing

grows harder. In automated chip testing, even a weak contact can distort results or damage devices.

Quasys GmbH's new test sockets and change kits address these issues by ensuring consistent electrical connections during ATE testing. Designed for high-frequency, temperature-controlled, and repeated measurements, they enhance accuracy in AI, 5G, and EV chip production where performance validation is critical.

GHz digitisers

Engineers working on phased-array radar, RF test benches, or high-bandwidth communications now have

new tools for synchronised, high-speed signal capture. The lineup of

fifteen models enables simultaneous, phase-accurate data acquisition across multiple channels, ideal for complex, real-time measurement, multi-sensor research, and next-generation communication system development.

RF conformance test system

Anritsu has upgraded its ME7873NR New Radio RF conformance test system to meet the European Radio Equip-

ment Directive (RED) and ETSI EN 301 908-25 requirements for 5G

devices. The system now verifies EU compliance for 5G New Radio equipment across FR1 and FR2 bands, ensuring manufacturers can validate safety and spectrum efficiency.

Multi-function calibrator

Calibration labs and electronics test facilities can now handle multiple instruments with one tool, the new

ZMMFC 5.5.3 multi-function calibrator from

Zeal Manufacturing. Designed for precise verification of high-resolution multimeters, clamp and panel meters, LCR meters, and non-contact tachometers, it outputs DC/AC voltage and current, frequency, resistance, capacitance, inductance, and RPM. Built-in safety features and microcontroller-based controls enable stable, protected, and efficient calibration across diverse measurement parameters.

Oscilloscope

Engineers debugging electronic systems can now capture fleeting or rare signal

events without sacrificing precision using the new Rohde & Schwarz MXO 3 oscilloscope series.

Designed for embedded design, power analysis, and EMI testing, it brings MXO-class speed and accuracy into a compact, affordable format.

EV testing solutions

Rising EV adoption is straining automakers and charger manufacturers to test faster and more efficiently.

Keysight's expanded end-of-line test lineup, EV2020B for vehicle systems and EV2020BE for EVSE, offers a unified, scalable solution for production validation. Used to test DC-DC converters, on-board chargers, and AC/DC charging systems, the platforms streamline integration, cut testing time, and help ensure compliance across evolving EV and charging standards while reducing manufacturing complexity and cost.

Vehicle telematics solution

Fleet operators and EV managers can now simplify tracking, diagnostics, and maintenance with ThingsUp's

new vehicle telematics solution.

Designed for electric, delivery, and

industrial fleets, the platform integrates GPS tracking, geofencing, and real-time health monitoring to boost uptime and efficiency. It supports multi-network global connectivity, EV battery data access, OTA updates, and IoT sensor inputs, offering unified, scalable fleet management even during outages or low-power conditions.

Power adaptor

ROHM's EcoGaN power stage IC, featured in Delta Electronics-designed adaptors for MSI's high-performance

laptops, brings GaN efficiency to portable computing.

Ideal for gaming

and high-load systems, it enables smaller, lighter adaptors that sustain high output, advancing GaN's role in efficient, eco-conscious power design.

AI server

ASUS has introduced the XA NB3I-E12 AI server, designed to power large-scale AI, scientific, and data-driven

workloads. It targets enterprises, cloud providers, and research institutions running large language models

or predictive simulations. The system's scalable, high-bandwidth design supports generative AI, financial modeling, and automotive inference, turning heavy data processing into faster, more reliable real-world intelligence.
