

Unique And Innovative Power Electronics Devices For India

Ayumu Miyoshi, Managing Director, Nichicon Electronics (India) Pvt Ltd

Why is India an important market for Nichicon's capacitor division? Why is Nichicon very upbeat about their SLBs and film capacitors for India? How are they gearing to tap the full potential of the Indian market? The Electronics For You team spoke to Mr Ayumu Miyoshi from Nichicon, and this article represents his thoughts...

As India's electronics manufacturing sector is expanding at a rapid rate, especially in automation, power grids and EV sector, it is creating a huge market for passive components like capacitors and batteries, which is great news for Nichicon, a leader in the energy storage segment.

Nichicon is a Japanese electronics components manufacturer, headquartered in Kyoto, Japan. We have built a strong reputation in the production of Aluminium Electrolytic Capacitors and Film Capacitors. We have been active in India since 2012, and have established offices in Bengaluru, Delhi, and Pune to support local customers.

The Indian market is incredibly important for us, mainly due to its large population and booming industries entering the electronics space, particularly automotive manufacturing. India leads as the largest producer of two-wheelers and ranks third in four-wheelers, across the globe. Thus, it creates a unique demand for capacitors that are best suited for EV two-wheelers, smart energy meters, solar products, and more. These are segments, where Nichicon is

a market leader, and hence success in these areas significantly contributes to our overall capacitor business growth.

Indian Engineers In Global Design Chain

Indian R&D engineers play a very important role for firms like Nichicon, because of the growing trend of dividing the design (R&D and new product development) process across different countries. For example, an application engineer in Europe develops a product, then a components engineer in India validates the components, followed by a procurement manager somewhere in Asia selecting the supplier for that component. This international division of the design process is becoming increasingly

popular, and Indian engineers are gaining importance because India has substantial tech manpower. It's now a trend for global companies to establish R&D functions in India and outsource parts of the design process. This "design win" activity in India contributes to increasing orders globally.

The Indian Market

Additionally, the Make in India and Design in India government policies have opened tremendous opportunities for us within India too. India's unique advantage is completing the entire cycle—from design conception to mass production—within the country. This allows us to engage with engineers during the crucial design phase, ensuring our components get selected early and carried through to full-scale manufacturing. We're capturing this opportunity by providing continuous support throughout the entire journey, from initial component validation all the way through production ramp-up.

That's the reason behind our investment in setting up offices across multiple cities in India. Plus, we have gradually

Samples & Eval Kits For R&D Teams

R&D or New Product Development teams that need samples or evaluation boards may contact Nichicon India team and share details of their company and project at: nin.exec@nichicon.com
