

Fig. 4: Organisation's overall inclination to invest in GenAI

manufacturing plants. Predictive maintenance is replacing outdated preventive models. Robotic process automation (RPA), test lab management, and energy efficiency platforms are becoming standard. Indian and European regions, in particular, are showing strong momentum as EV adoption rises and competition intensifies.

From design to production, GenAI is reshaping the automotive world. It is not just about AI-generated blueprints, it is about transforming the way automakers think, work, and deliver. GenAI is enabling a shift from product-centric to service-oriented models. Think ride-sharing, dynamic fleet management, personalised driving experiences, and predictive customer support, all powered by AI-driven insights.

What excites us most is how Indian auto majors and deep-tech startups are not just participating—they are leading. They are building innovative, tech-powered business models that optimise operations and boost customer satisfaction. GenAI is at the heart of this evolution. The convergence of IoT, AI, and automotive innovation is not some distant future—it's happening now,

and at full throttle. From autonomous driving and connected infrastructure to smart manufacturing and GenAI-powered services, the automotive industry is undergoing its biggest transformation in decades.

By 2030, GenAI is projected to boost productivity across the automotive value chain by 30-32%. That is not just a hopeful statistic—it is based on a well-grounded EY survey of industry readiness and use case execution. In a recent EY poll, when

asked, "What's been your experience with GenAI POC (Proof of Concept) engagement?"—a solid 57% of companies said they had already initiated GenAI pilots. Even better, 14% had moved beyond POCs and were already running GenAI solutions in production. That's huge! Another 38% were actively piloting solutions, and only about 5% had completed POCs but weren't sure of the impact yet. Clearly, the shift is no longer experimental—it is real, and it is scaling fast.

Generative AI is no longer a futuristic concept confined to labs or keynote slides. It is actively reshaping how we build, drive, and experience vehicles. From predictive maintenance to autonomous design, from EV infrastructure intelligence to smart manufacturing—GenAI is becoming the creative engine behind tomorrow's mobility. With Indian innovators leading alongside global players, the momentum is undeniable. **EFY**

This article is based on a session titled, 'The Impact of Generative AI on the Future of Automotive and Electric Vehicles' delivered by Adarsh BU, Solution Consultant, Happiest Minds at the EFY Expo Pune 2025. It has been transcribed and curated by Akanksha Sondhi Gaur, Senior Technology Journalist at EFY.

Anyone who stops learning is old, whether at twenty or eighty.
