Fig. 8: Accuracy of trained ML model

single sensor value, sound data spectrogram, temperature sensor, image data, or multi-axis value. The multi-axis value, which is the spectral data, is used in this case.

Next, select the learning block. Here, an option exists to choose how the ML model should be learned. It can predict, find the analogy, or classify. Depending on the design requirements, select either the classification or prediction option. Fig. 6 shows the impulse design.

Training and testing ML model

Go to the 'Generate Features' option and generate the features for the sensor data. After generating the features, save the generated data. The sensor graph can also be trimmed to extract features from the
