

Fig. 7: Location on the map when clicking on the link in the SOS message containing the location

‘ALERT, HIGH TEMPERATURE AT LOCATION.’

Fall acknowledgement. The system outputs a confirmation message indicating a fall alert.

For example: ‘ALERT, FALL AT LOCATION.’

Communication output through SMS notification. The system sends an SMS message to a predefined phone number with the GPS coordinates and additional information, for example: ‘ALERT, FALL AT LOCATION.’

Alert message - Alert indication.

The system logs an alert message for a central monitoring system or designated contacts, for example: ‘ALERT, FALL AT LOCATION: <https://www.google.co.in/maps/place/17.52115,78.63043>.’

Future scope

The future of human safety devices holds significant promise for development and enhancement that can further improve personal safety and expand its applications.

Integration of additional health monitoring features. Incorporating heart rate sensors and blood oxygen level monitors could provide a comprehensive health profile, enabling caregivers to respond to a broader range of medical emergencies. This enhancement would benefit elderly users or those with chronic health

conditions, allowing for continuous monitoring and timely interventions.

Companion mobile application. A mobile application working with the device could enable real-time monitoring, allowing family members or caregivers to track the user’s location and health metrics remotely. The app could facilitate communication between users and emergency contacts, providing a platform for sharing alerts and updates during emergencies.

Such advancements would enhance user experience and foster a greater sense of security for caregivers and families. **EFY**

Raghavendra Reddy Jakkidi is pursuing BTech in Electronics and Communication Engineering at Geethanjali College of Engineering and Technology, Hyderabad. He developed this project under the guidance of Dr P. Sudhakar (an Associate Professor at the same college).
