Diotec
Semiconductor

Process your Production at High Speed with Powerful Motors.

Driven by Diotec's Fast Switching IGBT DIW030F135

The precision of the robotics industry can potentially enhance production quality and reduce costs significantly.

This is achieved through the capacity to process real-time data, control motors, and drives, and ensure safety.

The transformation can potentially impact automotive mechanics and other industries, such as building materials or foundry industries.

A mass of microcontrollers enables the system to process a continuous stream of information from sensors and cameras, allowing the robot to perceive its surroundings, identify objects, and calculate the exact position and weight of the load it needs to lift.

Power semiconductors drive all the motors and allow the robotic system to handle heavy parts and components precisely and safely.

The fast-switching IGBT DIW030F135 from Diotec Semiconductor is a 30 A / 1350 V device in TO-247, which is used in the drive inverter stage of robotic motor systems.

It features very low turn-on and turn-off switching times, along with a low saturation voltage.

This part allows precise control of the robot's drive and helps to reduce parallel power losses thus saving energy.

The integrated free-wheeling diode leads to compact board design and time and cost-saving assemblies.
