COMPONENTS

RF Series Adaptive SoCs

AMD has expanded its Versal adaptive SoC portfolio with the Versal RF series, targeting aerospace, defence,

and test/measurement applications.

The devices support high-frequency (18GHz) multi-channel wideband signal capture, ideal for phased array radar, satellite communications, and spectrum operations. For test and measurement, it enables advanced spectral analysis and resampling.

TVS Diode

Littelfuse, Inc. has introduced the TPSMB asymmetrical TVS diode series, the first transient voltage suppression diode specifically designed for silicon carbide (SiC) MOSFET gate driver protection in automotive applications.

Its asymmetrical design supports the distinct positive and negative voltage ratings of SiC MOSFETs, ensuring reliable performance in electric vehicle systems such as onboard chargers, traction inverters, and Vcc buses.

Premium Smartphone Chip

MediaTek's Dimensity 8400 is a smartphone chip engineered to excel in AI-driven applications and mobile gaming. Its advanced NPU 880 supports AI tasks like translation and media

generation, alongside the DAE for adaptive, predictive AI experiences.

FPGA And SoC Stacks

Microchip Technology's PolarFire FPGA and SoC solution stacks address the complexity of power- and thermally-constrained applications in IoT, industrial automation, and smart robotics. Optimised for smart robotics and medical imaging, these stacks offer AI-powered 4K60 computer vision. Key features include SmartHLS IDE and VectorBlox Accelerator SDK for C/C++ and machine learning development.

Voltage Level Translators

Nexperia's NXU series fixed-direction voltage level translators streamline communication between host processors and peripherals. They deliver high data rates, robust drive strength, and glitch-free power sequencing while reducing power consumption by over 50%. Supporting a wide voltage range, they suit compact, high-performance applications in automotive, industrial automation, and consumer electronics.

Adaptive Dynamic Voltage Control

NXP's new MCX L series sets a benchmark for low-power technology,

leveraging a 40nm ultra low power process and adaptive dynamic voltage control. With robust security, SDK support, and long-term availability, the series excels in industrial and IoT applications.

Compact Relay

Panasonic Industry introduces the AQY231R1WY PhotoMOS relay in a compact package tailored for measurement, test, and medical applications.

Its miniature design reduces mounting area by 89%, ideal for compact equipment

like IC testers, medical devices, and semiconductor testers. Operating up to +125°C, it outperforms traditional relays, with low power consumption and high-frequency transmission.

PCIe SSD Controller

Phison Electronics continues to redefine storage technology with groundbreaking innovations. It delivers record-breaking speeds of 14.5GB/s, catering to gamers, content creators, and enterprises. The company claims it to be the world's first DRAM-less PCIe Gen5 SSD controller, which offers over 10GB/s performance, combining speed with cost efficiency.
