

and the RAA489400 USB Type-C port controller. The RAA489118 can charge two to seven battery cells or act as a voltage regulator. Its robust ripple regulator technology ensures noise-free, efficient performance, ideal for power tools and industrial applications, including solar power systems.

Infrared Laser Diode

ROHM's RLD8BQAB3 is a high-output laser diode designed for lidar applications in advanced driver assistance systems, drones, robot vacuums, AGVs, and service robots. The patented narrow laser emission width technology enables superior lidar performance with reduced interference. Its low wavelength temperature dependence and uniform intensity enhance detection in diverse automation applications, including 3D ToF systems.

Thin-Film Power Inductors

TDK Corporation has introduced the PLE856C series, ultra-compact thin-film power inductors tailored for wearable devices like wireless earbuds, smartwatches, and fitness trackers. With inductances ranging from 470nH to 1.5µH, they serve key industries such as IoT and consumer electronics, making them essential for miniaturised, high-performance device designs.

GNSS Chip

u-blox has introduced the UBX-M10150-CC GNSS chip, designed to revolutionise wearable devices with ultra-low power consumption, exceptional accuracy, and a compact form factor. Its compact size allows manufacturers to

create sleeker, lighter wearables, including sports and smartwatches, without sacrificing performance. The chip's efficiency and advanced capabilities make it ideal for next-gen wearables.

MELF Resistors

Vishay Intertechnology, Inc. has expanded the resistance range of its AEC-Q200 qualified thin-film MELF resistors, offering sizes 0102, 0204, and 0207. This enhances stability and reliability, making them suitable for telecommunications, industrial, and medical applications such as precise current sensing, power supplies, and automation.

DC/DC Converters

Traco Power's TEC 3UI series of compact DC/DC converters offers an ultra-wide 8:1 input range, suitable for space-constrained environments. With 1600V DC I/O isolation, the TEC 3UI delivers reliability and efficiency for industrial automation, telecommunications, and renewable energy applications, providing a durable, cost-effective solution.

System-on-Module

MYIR has introduced the MYC-LT536 system-on-module (SOM), powered by the Allwinner T536 chip, equipped with an optional neural processing unit delivering up to 2 TOPS for enhanced machine learning and AI tasks. The SOM targets industries such as robotics, automation, and IoT, offering a versatile solution for industrial control systems, human-machine interaction, and edge computing. It's suitable for tech startups, researchers, and manufacturers, with custom ODM

and OEM solutions available.

EMBEDDED

Compact IoT Board

IndusBoard has introduced Coin V2, a coin-sized board with a redesigned layout that increases sensor density while maintaining a compact form.

Despite its size, it is helpful for electronics hobbyists and makers due to its Arduino-compatible design, flexible circuit board, and JST battery connector. Industrial designers and engineers can use the board for sensor networks, monitoring systems, and embedded controls. Educational institutions and students can use Coin V2 to learn about circuit design, programming, and IoT.

Computer-on-Modules

Congatec has introduced computer-on-modules powered by NXP's i.MX 95 processors, enhancing its portfolio with ARM-based edge AI solutions. Designed for industrial and low-power applications, they cater to sectors such as robotics, medical imaging, and transportation. With enhanced GPU performance, real-time controllers, and versatile connectivity options, they are optimised for cost-effective, scalable, and secure edge computing solutions.

IoT Prototyping Platform

Nordic Semiconductor has launched the Thingy:91 X, an advanced IoT prototyping platform designed for LTE-M, NB-IoT, Wi-Fi SSID location-ing, DECT NR+, and GNSS applications. Developers can leverage preloaded SIM cards from Onomondo and Wireless Logic for
