

FASTEST FINGER FIRST With Arduino Mega And P10 Display

PALLA SIVA KUMARI AND RAMAYANAM LAVANYA

Fastest finger first indicators (FFIs) bring precision to quiz games, measuring contestants' reaction times with accuracy. Supporting up to eight teams, the system identifies the first to press their button while locking out others. A P10 LED display module highlights the winning team in real time.

The device employs an Arduino Mega, designed for setups with eight or more players. Its capacity can be expanded to support over 30 players

by modifying the code to handle additional inputs. Components required are listed in the Bill of Materials table. Fig. 1 displays the prototype.

Circuit diagram and working

Fig. 2 shows the circuit diagram of the fastest finger first system. It is built around an Arduino
