

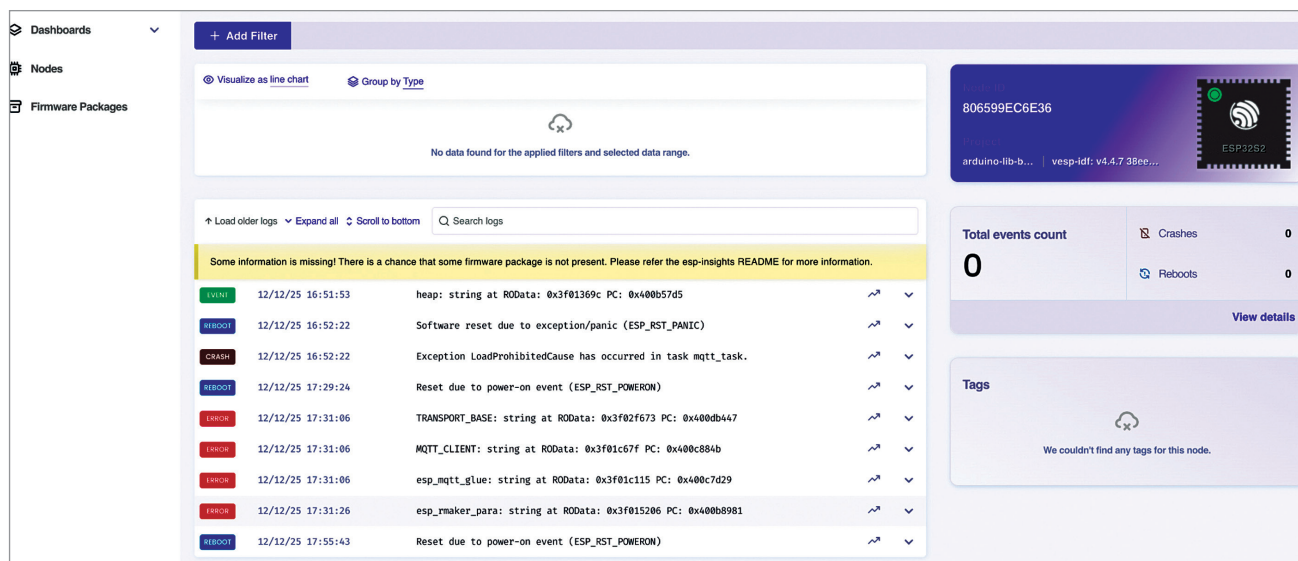

Fig. 9: Rainmaker dashboard showing the insights of clients' devices

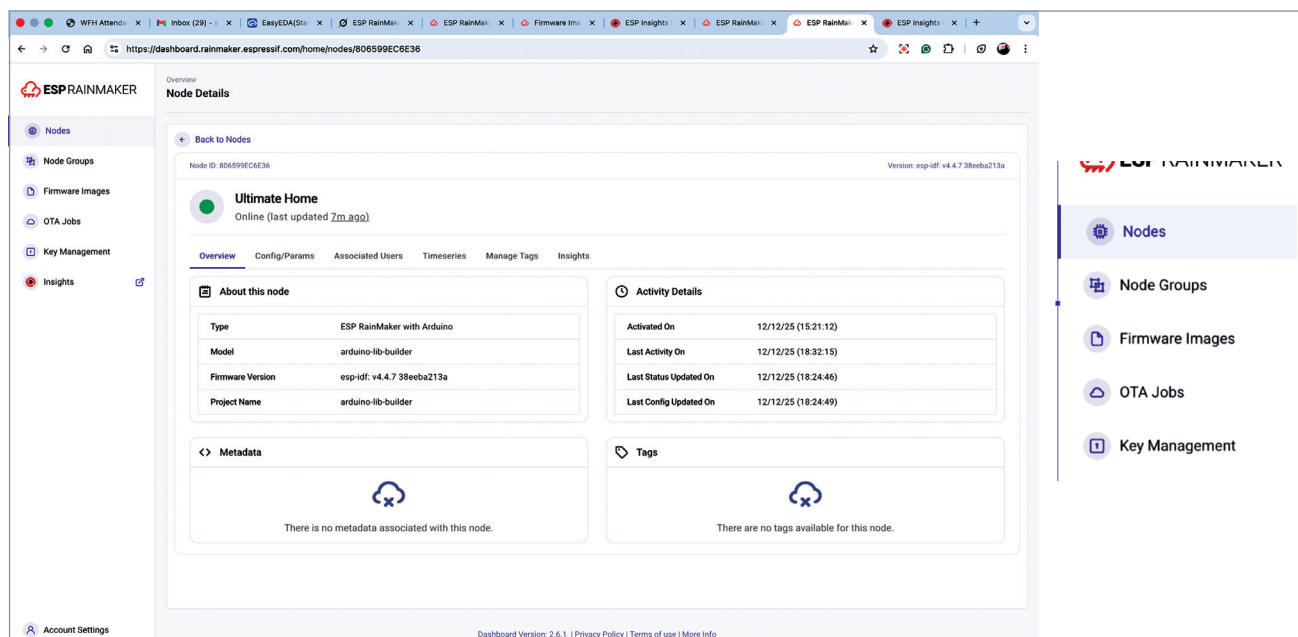

Fig. 10: Managing client device firmware and OTA updates using RainMaker

The devices can now be viewed in the RainMaker app for control and monitoring, including million-colour light control, fan speed control, switches, and temperature monitoring. Additional sensors, such as motion, light, or actuators, can be added by modifying the code and repeating the provisioning process.

Fig. 7 shows the app UI displaying all devices for control and temperature monitoring, along with

an additional customised device UI showing electricity consumption, energy usage, light status, and other sensor data.

Adding device to AI assistant

The system can be integrated with AI assistants such as Alexa, Apple Home, and Google Assistant to enable voice control and automation.

To integrate with Alexa or Google Assistant, go to User Options

and select the appropriate option. Follow the on-screen instructions. In this example, the device is linked to Alexa. Sign in to an Alexa account to complete the linking process.

Once linked, the device appears under the 'Devices' section in the Alexa app. Custom voice commands and automation routines can then be created using the app. Fig. 8 shows the device linking process and the Alexa app displaying the linked devices.
