

Motion tracking solutions

TDK has rolled out SmartMotion motion tracking solutions that embed sensor fusion and edge intelligence

directly into 6-axis IMUs, shifting motion analysis from host processors to the sensor to

reduce power consumption and extend battery life. Aimed at TWS earbuds, smart watches and fitness bands, and smart/AR glasses, these units support gestures, activity detection, head orientation, and stabilisation with on-chip machine learning for more responsive, low-power wearables.

High-performance SoCs

Texas Instruments has expanded its automotive compute and sensing portfolio to support centralised AI and

sensor fusion for advanced driver assistance and up to SAE Level

3 autonomy in modern vehicles. The update includes high-performance SoCs with scalable edge AI, an 8×8 4D imaging radar transceiver for richer object detection, and a 10BASE-T1S Ethernet PHY to extend high-speed networking to vehicle edge nodes. These components aim to unify perception, AI decisioning, and connectivity in software-defined vehicle architectures, improving real-time environment awareness and system integration for ADAS and autonomous functions.

High-speed safety comparator

Toshiba's new TC75W71FU CMOS dual comparator offers faster overcurrent

detection with high-speed response and full rail-to-rail input/output, supporting operation from 1.8V up to Vcc. Its

quicker propagation delays help trigger immediate shutdowns in fault conditions, making it suitable for industrial

robots, UPS and power systems as well as consumer appliances. Variants with added noise immunity and open-drain output are planned to broaden design flexibility.

Compact transmissive sensors

Vishay's new compact transmissive optical sensors pack an IR emitter and phototransistor(s) into a small

5.5×4 mm surface-mount package with 42% more vertical headroom, addressing motion and posi-

tion detection where space and tolerance are tight. They fit into industrial automation encoders, turn-and-push controls, consumer appliances and entertainment gear, plus healthcare devices, switches/relays, antennas and broadband routers, with options for single- or dual-channel direction sensing.

Thermal RF power sensor

Rohde & Schwarz has introduced the R&S NRP150T thermal RF power

sensor, a single-sensor solution covering continuous DC to 150GHz with a 0.80mm RF connector, eliminating

the need to swap heads across bands. It delivers up to 500 measurements/sec and direct USB/PC or mobile connectivity, helping engineers streamline automotive radar validation, high-frequency comms, satellite links, and RF instrument calibration while cutting test time and setup complexity.

Liquid flow sensors

Posifa Technologies has expanded its PLF2000 series MEMS liquid flow sensors with calibrated variants tailored for ultra-low-flow medical and microfluidic systems where precise fluid delivery is critical. These

compact sensors, with ranges from ~ 30 ml/min to ~ 200 ml/min, deliver

fast (~ 100 ms) and stable readings for closed-loop control in lab automation reagent delivery, micro-

fluidics and organ-on-chip perfusion, flow cytometry, bioreactors, infusion pumps, and analytical instruments.

Indian dual-core microprocessor

India's DHRUV64 marks a milestone as a fully indigenous 64-bit, dual-core

microprocessor developed under the Microprocessor Development Programme, advancing the country's semicon-

ductor self-reliance goals. Designed for seamless integration with modern hardware, it targets 5G infrastructure, automotive control systems, industrial automation, IoT devices, and networking equipment, offering a domestic compute platform for strategic and commercial electronics without reliance on imported chips.

EMBEDDED

AI accelerator module

Virtium's new M.2 AI accelerator module aims to tackle one of the toughest challenges in edge AI,

memory-related latency, power draw and system complexity, by delivering 24

TOPS compute entirely from on-chip SRAM without external DRAM.

Designed in a standard M.2 2280 form factor with industrial-temperature support, it enables real-time vision AI in industrial automation, automotive perception, and defence systems, with lower power, reduced footprint, and easier integration.
