

Edge-AI hardware platforms

New edge-AI hardware platforms by Raspberry Pi are enabling generative models to run directly on devices, shifting AI workloads away from the cloud. Designed for low latency and data privacy, these products support on-device generation and reasoning for applications such as smart cameras, industrial automation systems, and voice-enabled consumer electronics.

Embedded controllers

Microchip has rolled out custom firmware for its MEC1723 embedded controllers to strengthen security, power management, and system control in AI workstations and personal supercomputers such as the Nvidia DGX Spark. The firmware adds secure boot, advanced power sequencing, alert handling, and optimised interfaces to support reliable operation under heavy AI workloads. It is positioned for industrial systems, data centre AI desktops, and high-performance computing rigs that need robust, efficient platform management.

Development board and breakout board

ADI's EC200U 4G LTE GNSS development board and breakout board address a common headache in IoT design by combining cellular connectivity and precise positioning into

ready-to-use modules, reducing the need for additional parts and integration hassle. With LTE Cat 1 (plus 3G/2G fallback) and multi-constellation GNSS, they speed up the development of smart meters, asset/fleet trackers, remote sensors, and monitoring systems, helping teams prototype and deploy connected, location-aware devices faster.

Edge AI compute module

ADLINK has introduced a new edge AI compute module built on Intel's latest high-performance processors to tackle heavy AI inference and graphics tasks directly on embedded systems without external accelerators. The compact, ruggedised module delivers up to ~180 TOPS combined AI and GPU performance, supports large DDR5 memory and industrial-grade networking, and is suited for industrial automation, autonomous robotics, advanced imaging, machine vision, and other mission-critical edge AI applications.

Embedded AI processors

AMD's new embedded AI processor family combines multicore CPUs, integrated GPUs, and next-gen neural engines to handle real-time graphics and on-device AI inference inside power- and space-limited embedded systems. Built for automotive

instrument clusters, industrial HMI/automation and other edge environments, the chips drive high-resolution displays, gesture/voice recognition, and safety-critical workloads locally without external accelerators, backed by a unified software stack for multi-OS development.

MANUFACTURING EQUIPMENT & MATERIALS

High-temperature synthetic oils

In surface-mount reflow ovens, conveyor chains and related mechanics

wear out early because conventional lubricants break down under intense heat and corrosive flux vapours, leading to chain stretch, roller binding, vibration, and unexpected stoppages

that raise maintenance costs and downtime. High-temperature synthetic oils that resist oxidation and carbon deposits can maintain lubrication at >300°C, reduce friction and vibration, and extend SMT line uptime.

Scaling board and tool cleaning systems

Kolb's new 6 series cleaning systems are designed to help electronics manufacturers boost throughput

without expanding their footprint by more efficiently handling board and tool cleaning

on crowded production lines. The PSE LH6, AQUEBE LH6, and XH6 can process up to 246 Eurocards per cycle and
