TEST & MEASUREMENT

High power test systems

Engineers developing electric vehicles and e-mobility systems are seeing new high-power battery cycling and emulation test platforms that let them evalu-

ate batteries and powertrain components under realistic

conditions without physical packs. These systems support high-voltage, high-current charge/discharge power hardware-in-the-loop scenarios and multi-standard charging and driving profiles, helping validate battery performance, durability, and motor power/efficiency early in development and shortening EV test cycles.

Measurement system

KEYENCE's IM X instant measurement system aims to eliminate slow, manual dimensional inspection by letting operators 'place and press' parts for immediate measurement

without fixturing or complex programming. Capable of capturing up to 5000 dimensions in

a single cycle on a large 500mm stage, it delivers accurate 3D and height data in about one second. The system's rapid, automated inspection suits prototype, in-process and final quality checks across modern manufacturing workflows where throughput and tight tolerances matter.

AI-driven inspection platforms

New AI-driven inspection platforms

for electronics manufacturing are blending high-resolution imaging with machine-learning to boost defect detection and throughput on the shop

floor. By uniting 3D X-ray, optical, and solder-paste

inspection under a shared AI software stack, these systems dramatically reduce setup times and aim for >99% accuracy on complex PCBs, advanced packages, and dense assemblies, while linking into smart factory data standards for seamless line integration.

MISCELLANEOUS

AI software integrity builder

Keysight's AI software integrity builder is a new lifecycle-focused platform for validating, explaining, and monitor-

ing AI systems, addressing gaps in ensuring trustworthy behaviour in safety-critical

domains such as automotive and industrial automation. It spans dataset quality checks and bias analysis, model explainability, real-world inference testing, and continuous performance monitoring, helping engineering teams identify issues early and maintain compliant, transparent AI deployments under tightening regulatory standards.

eWatch energy monitoring sensor kit

Factories are grappling with rising energy costs and poor visibility into what machines actually consume. An

eWatch energy monitoring sensor kit from Tranquility IoT &

Big Data Solutions lets teams retrofit real-time, machine-level energy

measurement on existing equipment in minutes, showing run/idle times, current/voltage spikes and more.

It supports 1-1000A per phase with wired or wireless links and integrates additional sensors (temperature/pressure) for broader shop-floor health and energy insights.

ROG NeoCore router

ASUS unveiled its WiFi 8 concept ROG NeoCore router at CES 2026, demonstrating the first real-world WiFi 8 throughput test. The new generation

promises up to 2x higher mid-range throughput, 2x wider IoT

coverage, and up to 6x lower latency versus WiFi 7. Designed for AI-driven smart homes, cloud streaming, and multi-device gaming, WiFi 8 delivers low latency, ultrahigh reliability, and seamless coordination across multiple devices, marking a step-change in home connectivity.

Open source autonomous driving platform

Nvidia has unveiled a new open source autonomous driving platform that blends reasoning AI with

high-fidelity simulation and a large, real-world driving dataset to improve how

audio-visual systems handle rare and complex road scenarios that current stacks often miss. The suite pairs vision-language-action models with closed-loop virtual testing and tools for distilling large 'teacher' models into smaller, vehicle-ready versions, aiming to accelerate development and safety validation for next-gen autonomous vehicles.
