Sensors and magnetic switches

Allegro MicroSystems Inc. has introduced new sensors and magnetic

switches for use in cars, factories, and everyday products. These new

switches, APS11753 and APS12753, use less power—50% less than previous models—helping extend battery life. They work well even with changes in the distance or position of parts, making them useful for devices that run on batteries, like medical tools or consumer electronics. These switches sense motor positions, reduce vibrations, and save energy.

Radiation-hardened NOR flash memory

Infineon Technologies have introduced the first radiation-hardened-by-design

512 Mbit QSPI NOR flash memory for space and extreme environments. QML-qualified

and based on SONOS technology, it delivers exceptional radiation resilience and SEE performance. This high-density memory suits applications like FPGA configuration storage and boot code for multicore processors, setting a new benchmark in space technology.

Industrial automation microprocessors

Renesas Electronics have launched the RZ/T2H, its highest-performing microprocessor (MPU) for industrial

automation. Featuring dual Cortex-R52 CPUs at 1GHz with 576kB tightly coupled memory, it combines real-time processing and application capabilities. Designed for PLCs, motion controllers, and

CNCs, the RZ/T2H enables precise, high-speed robot control and real-time operations, addressing automation demands and improving industrial efficiency.

Car safety sensors

TDK Corporation has introduced two sensors, the SmartAutomotive IAM-20685HP and IAM-20689, designed for car safety systems like advanced

driver assistance systems (ADAS). They are used in safety features like electronic stability

control and drive-by-wire systems to improve car safety. Both sensors are easy to integrate because they have the same design and can work without extra software for safety checks. They are built to be reliable and meet automotive industry standards.

150V compact power MOSFET

Vishay Intertechnology has released the SiRS5700DP, a 150V power

MOSFET in a compact package. This MOSFET has lower

resistance, improved performance, and higher current capability than

older versions. It is designed for use in telecom, industrial, and computing applications where efficiency and reliability are important. The MOSFET can be used in systems like power supplies, solar inverters, motor drives, and battery management.

Embedded eSIM LTE module

U-blox have introduced the SARA-R10001DE LTE Cat 1bis module with an embedded eSIM for IoT connectivity.

Designed for telematics, smart homes,

asset tracking, and POS systems, it simplifies logistics by eliminat-

ing external SIM cards and reducing SKU variations. Its design improves reliability, making it suitable for harsh environments and global 4G LTE transitions. This innovation streamlines IoT deployment, providing connectivity while optimising resource management for developers and businesses worldwide.

Ultra-low-power IoT Wi-Fi 6 and Bluetooth LE 5.4 modules

Silicon Labs has launched the SiWx917Y, an ultra-low-power Wi-Fi 6 and Bluetooth LE 5.4 module designed for IoT applications like smart homes,

healthcare, and asset tracking. With integrated antennas, pre-certification for global RF standards, and support for the matter protocol, they simplify design and accelerates time-to-market. They are ideal for next-gen connected devices.
